

4000 Series

Waterborne Epoxy Clear/Color Seal & Fast Prime

Need a quality clear sealer for your next job? Stop using 5 different products to cover your residential, commercial, and light industrial concrete work! You need a Versatile sealer that can perform and multi-task your sealing needs. Versatile has the solution, with the introduction of the 4000 Series sealing system. This new 2-component waterborne epoxy technology is easy to apply, MVE tolerant, ultralow odor, VOC compliant, capable of going over "green" concrete, and provides a great "wet" look similar to solvated acrylics. 4000 is so easy to apply that even the "Do It Yourselfer" can apply it. Want to know more? Read on and find out why it works...

Epoxy Technology w/o MVE Problems

Moisture vapor emissions (MVE), in sufficient quantity, can effectively reduce the adhesion of a sealer to concrete by inhibiting the polymers contact with the substrate during application and cure. A sealers ability to adhere to a concrete substrate with high MVE can be directly related to the polymer's ability to penetrate into the small capillaries within the concrete. Systems based on epoxy, urethane, and urea technology often fall victim to MVE related failures because of their inability to penetrate into the substrate surface during application, due to a finite layer of water and vapor pressure that forms underneath the coating during application. Oftentimes, a coating will achieve marginal adhesion, only to fall victim to subsequent MVE pressures exerted underneath the coating, which effectively lift the coating from substrate.

4000 Series is capable of adhering to, and withstanding the effects of moisture vapor emissions from concrete floor slabs. The sealer system utilizes a proprietary resinous technology that allows the polymer to penetrate deep within the concrete, where it "wicks" through the finite water layer and adheres to the walls of the capillary. The resulting cured polymer permanently anchors the coating system to the concrete, ensuring reliable adhesion where other systems are questionable.

"Green" Concrete, No Problem

"Green" concrete can present a very large problem for many sealing systems that are of otherwise high quality. During the early stages of cure, concrete contains a very large amount of unhydrated, semi-soluble salts that can act as bond-breakers, and/or haze out a coating. The field of sealer options is significantly narrowed when the application calls for a sealer over freshly poured concrete, leaving little more than cheap waterborne acrylics.

4000 Clear Seal Primer polymer technology allows it to be used over "green" concrete, as early as 1-2 hours after pouring. The same proprietary technology that allows the system to penetrate into regular cured concrete, also allows it to penetrate through unhydrated salts, to the hydrated portion of the cement and aggregate in the concrete. Best of all, the sealer does this without hazing, cracking, or delaminating from the fresh concrete.

Looks Great Too!!!

4000 Clear Seal not only performs, but looks great doing so. The systems ability to penetrate deep into the concrete gives it a very deep wet look, often found with decorative solvated acrylic systems. The sealer also develops very high gloss, due to the strong polymer film developed as the systems crosslinks.

4000 Clear Seal Provides a "Wet Look" to Concrete for an Industrial Look

4000 is so easy to apply that even the "Do It Yourselfer" can apply it.

Features and Advantages:

- ✓ Clearseal Provides a "Wet Look"
- ✓ Also Works as a Primer
- ✓ Colorseal Works Great for Chipping Into
- ✓ Fast Drying
- ✓ Low Odor
- ✓ VOC Compliant
- ✓ Stain Resistant
- ✓ Hot Tire Resistant
- ✓ Clearseal is Great for Retail Concrete
